

Faith Tribe — Design Brief

For: the UI/UX designer **About:** Faith Tribe — a daily Bible app for teenagers (starting with RCCG Region 63) **Where we are:** The backend is built and live. Now we need the screens designed.

1. What we are building

Faith Tribe helps teens spend time with God and read the Bible every day.

It has a **mobile app** and a **website**.

The app has 5 tabs at the bottom: **Today · Bible · Library · Tribe · Me**. The Bible is in the middle, on purpose.

2. How it should feel

Three words: **Warm. Calm. Alive.**

- **Warm** — rounded shapes, soft colours, friendly words.
- **Calm** — lots of space, one main thing per screen.
- **Alive** — gentle movement and small happy moments (think a leaf growing, not confetti).

It should feel like the *opposite* of a noisy social media feed. Quiet, kind, and easy.

The big rule: The Today screen shows ONE main thing — today's short reading and its Bible verse. It is not a busy dashboard.

3. Please read these first

These are the rules. I have written a **plain-English version of each one** for you (in the `docs/designer/` folder). Read them before you design:

- `designer/1-look-and-feel.md` — how it should look and feel (**most important**)
- `designer/2-colours-and-building-blocks.md` — colours, fonts, spacing, buttons, cards
- `designer/3-all-the-screens.md` — the full list of screens
- `designer/4-getting-around.md` — how people move around the app
- `designer/5-how-the-words-should-sound.md` — the writing style

- `designer/6-make-it-hooking.md` — how to make it engaging and habit-forming (the right way)
- `designer/7-children-direction.md` — (*planning only*) the future children's version (ages ~4–12; design after teen V1)

Each one also names the full technical version (files `09`, `10`, `04`, `05`, `11` in `docs/`) if you ever want the deep detail. If this brief and the look-and-feel rules ever disagree, follow the look-and-feel rules.

4. Two things to design

1. The App — for teens, on the phone. Calm and simple. Big tap targets.

2. The Website — this has two parts: - A **landing page** to welcome new people and help them install the app. - A **Console** — a desktop tool for church leaders (add events, publish readings, check people in). This one can be denser, like an admin tool.

Same colours for both. But the app stays calm; the Console is a work tool.

5. Colours and fonts (already chosen — please reuse)

Do not pick new ones. Use these:

- **Green** `#10B981` — the main colour (buttons, the active tab). Use it a little, not everywhere.
- **Amber** `#F59E0B` — for happy / celebration moments only.
- **Backgrounds** — soft off-white (not pure white). Dark mode uses soft dark (not pure black).
- **Font** — Inter.

Your job: turn these into a full set of design tokens in Figma, for **light mode**, **dark mode**, and a **sepia mode** (a warm paper colour for Bible reading).

6. What to design now

The backend is ready for all of these. Design them in this order.

First — the daily habit: 1. **Sign up / Log in** — by email, phone, or Google 2. **Today** — the reading, the verse of the day, the daily streak, one small challenge 3. **The reading page** — with links that open the Bible 4. **Bible reader** — the calmest screen. Pick book, chapter, verse. Two versions (WEB, KJV). Change text size. Share a verse.

Next — content and events: 5. **Library** — articles, videos, podcasts. Save items. Audio keeps playing in the background. 6. **Events** — see an event, register, pay (Paystack), get a QR ticket. 7. **Tribe** — church notices and your church info. 8. **Me** — profile, progress, saved items, notifications, settings.

Then — the guest view: 9. The same screens for people who have not signed up. They can read, but some buttons say “Sign up to...”. The Bible is always free to read.

7. Do NOT design these yet

These come in a later version. Do not draw finished screens for them. If a screen links to one, just show a simple “**Coming soon**” state:

- Bible highlights and notes
- Reading plans and Journeys
- Badges and certificates
- Friends, prayer wall, groups
- **Community notes, likes, and reposts** (a later version — see below)
- Parent access

Note on community notes: the plan is for teens to post short notes (like “God showed up for me today”), and other teens can **like and repost** them, with the counts shown. This is a *later version* (V2), after the safety and moderation tools are built — so please do **not** design it now. Just leave room for it under the Tribe tab and show a simple “Coming soon”.

8. Every screen needs these versions

A screen is not finished until you show all of these:

1. **Normal** — with real content (real words, not “lorem ipsum”)
2. **Loading** — a soft grey placeholder shape (not a spinning wheel)
3. **Empty** — a small picture + one line + one button
4. **Error** — a clear, kind message that tells people how to fix it
5. **Offline** — works with saved content, shows an “offline” bar
6. **Dark mode** — for every screen (teens read at night)

9. Rules you must follow

Required for launch:

- Text must be easy to read (strong colour contrast).
- Taps at least **44 × 44 px** (fingers on cheap phones).
- Still works when the user makes text twice as big.
- Always use an icon **and** a label — never colour alone.
- Gentle motion only. Nothing flashing or looping.

Please **do not**:

- No endless scrolling.
- No auto-playing videos.
- No scary messages like “your streak is about to die!”
- No follower counts or popularity numbers on profiles, friends, or streaks. (Community notes *will* get public likes and reposts — but that is a later version, so do not design it now.)
- No guilt or pushy pop-ups.

10. Screen sizes

- Design for the **phone first** (360 px wide).
- Also show tablet and desktop where the layout really changes.
- In the app, reading text stays narrow and easy to read, even on big screens.
- The Console is built for desktop.

11. What to hand over

1. Figma **colour / spacing / font tokens** (light, dark, sepia) — do this first.
2. A **component kit** — buttons, cards, inputs, tabs, and so on.
3. All the **screens**, grouped by the 5 tabs + website + Console.
4. Simple **click-through prototypes** for: sign up · reading → Bible → back · event sign-up → payment → ticket.
5. A set of **icons and friendly pictures**. Teens should see themselves — Nigerian teens, real skin tones and hair.
6. **Real words** on every screen (match file 11).

12. Two things to check early

1. Does the Inter font support Yoruba letters (ẹ ọ ẹ)? We may need this later.
2. Pick the serif font for Bible reading.

13. Done when...

- The token kit and component kit are built.
- Every "first" and "next" screen is done in all versions (normal, loading, empty, error, offline, dark).
- The reading → Bible → back flow is prototyped.
- The landing page and the Console are done.
- Every screen passes the reading / contrast / tap-size rules.
- No "later version" feature is fully designed — only shown as "Coming soon".

If anything here clashes with files 09 and 10, follow 09 and 10. The look-and-feel rules always win.
